

Rainwater for your dams

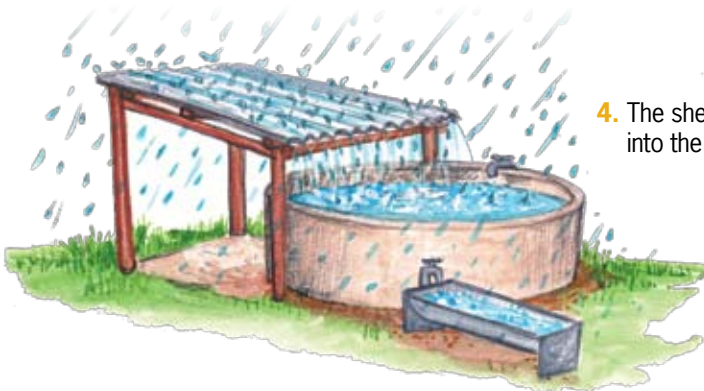

Water is a scarce and precious commodity and we need to take great care to conserve it. Water is a very important aspect of farming with dairy cattle, any other livestock and crops. Here is an easy way to harvest rainwater straight into your farm dam.

1. Collect five or six metal sheets (the corrugated iron used for roofs will do).
2. Cut wooden poles or buy metal poles of different lengths to support the sheets.

3. The poles at the back should be longer than the support poles next to the dam.

4. The sheets will direct water into the dam when it rains.
